1 CONCLUSION

The conclusion and results stated in this test report are based on a non-recurrent examination of sample(s) provided by the applicant.

The tests described in this report do not result in the right to use any approval mark as conferred by DEKRA. As far as the tests were based on certain specifications, these are mentioned in the report.

1.1 Model description

The apparatus as supplied for the test is Grid-Connected PV Inverter, models EA5KTSI, EA6KTSI, EA8KTSI, EA10KTSI, EA13KTSI, EA16KTSI.

According to the declaration from manufacturer, all the models are identical except for the power.

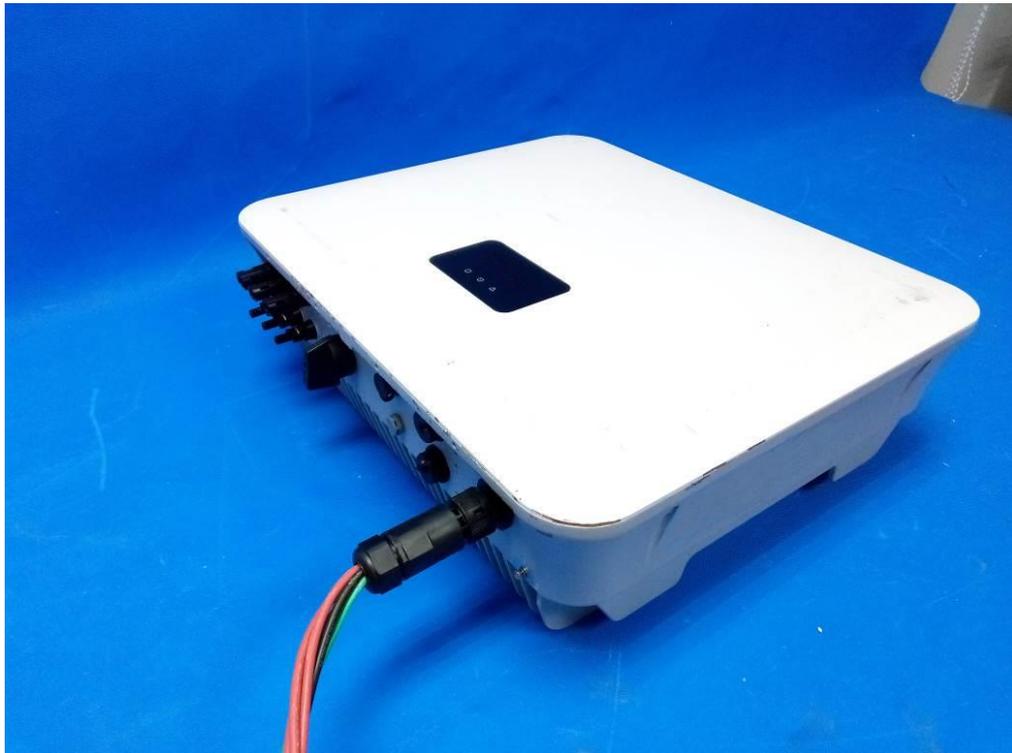

Figure 1 Overview

Figure 2 Overview

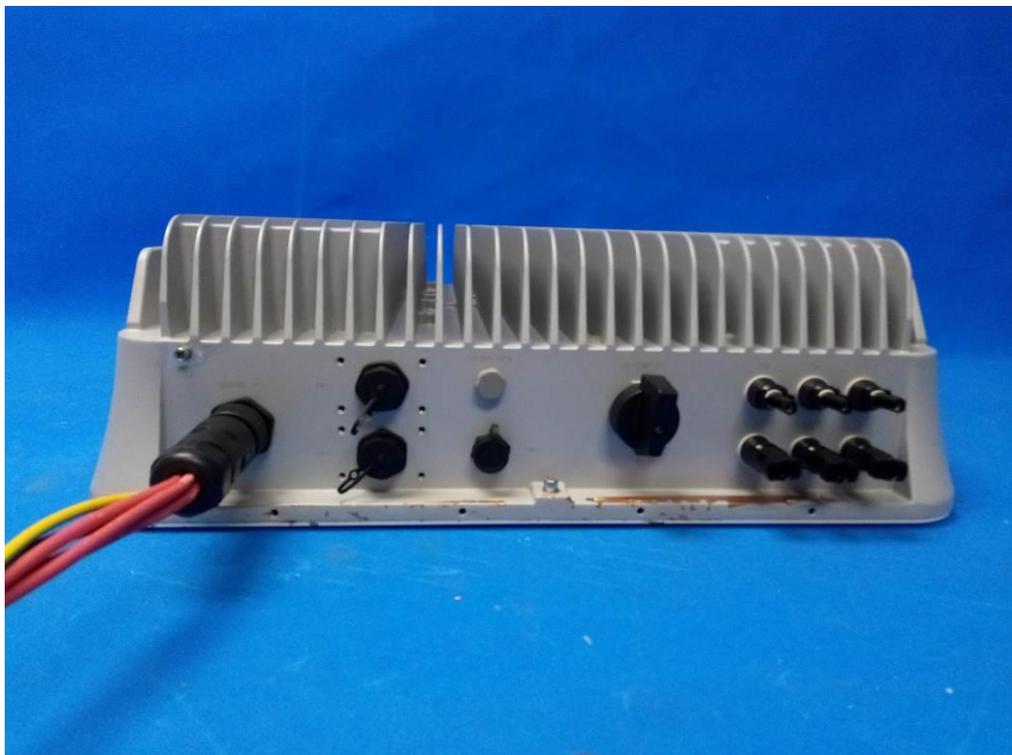

Figure 3 Overview

2 SUMMARY

This chapter presents an overview of standards and results. Refer to the next chapters for details of measured test results and applied test levels.

2.1 Applied standards

Standard	Year	Title
EN 61000-6-4	2007	Generic standards — Emission standard for industrial environments
A1	2011	
EN 61000-6-2	2005	Generic standards — Immunity for industrial environments

Standard	Year	Title
EN 61000-6-3	2007	Generic standards — Emission standard for residential, commercial and light-industrial environments
A1	2011	
AC	2012	
EN 61000-6-1	2007	Generic standards — Immunity for residential, commercial and light-industrial environments

Note: The test in this report uses the lower limit (EN 61000-6-3) for Emission, uses the higher level (EN 61000-6-2) for Immunity. Use EN 61000-6-1 and EN 61000-6-2 for Voltage dips and interruptions.

2.2 Overview of results

Emission tests	Result
Conducted Emission(Mains Ports)	PASS
Conducted Emission(Telecommunication Ports)	N/A
Radiated Emission	PASS
Harmonic current emission	PASS
Voltage fluctuations and flicker	PASS

Immunity tests	Result
Electrostatic discharge	PASS
Radio frequency electromagnetic field	PASS
Electrical fast transients	PASS
Surges	PASS
Radio-frequency continuous conducted	PASS
Power frequency magnetic field	PASS
Voltage dips and interruptions	PASS

3 GENERAL INFORMATION

Equipment under test	Grid-Connected PV Inverter	
Trade Mark	EAST	
Types	EA5KTSI, EA6KTSI, EA8KTSI	EA10KTSI, EA13KTSI, EA16KTSI
Ratings	Input: max 1000Vdc, MPPT voltage range: 120-950Vdc Output: 230/400Vac, 50Hz, 5000VA / 6000VA / 8000VA	Input: max 1000Vdc, MPPT voltage range: 200-950Vdc Output: 230/400 Vac, 50Hz, 10000VA / 13000VA / 16000VA

3.1 Customer Information

Applicant	EAST Group Co., Ltd.
Address	No.6 Northern Industry Road, Songshan Lake Sci. & Tech. Industrial Park, Dongguan City, Guangdong Province, China

Manufacturer	EAST Group Co., Ltd.
Address	No.6 Northern Industry Road, Songshan Lake Sci. & Tech. Industrial Park, Dongguan City, Guangdong Province, China

Factory	EAST Group Co., Ltd.
Address	No.6 Northern Industry Road, Songshan Lake Sci. & Tech. Industrial Park, Dongguan City, Guangdong Province, China

3.2 Test data

Location	DEKRA Testing & Certification (Suzhou) Co., Ltd.
Address	No.99 Hongye Rd., Suzhou Industrial Park, Suzhou,215006, Jiangsu, China
Date of receipt of test item	Apr. 2019 (samples provided by applicant)
Date (s) of performance of tests	Apr. 2019
Supervised by	Star Wang

3.3 Environmental conditions

Tests have been performed in a controlled laboratory environment, where the environmental conditions are maintained within the applicable ranges.

Ambient temperature	15 °C – 35 °C
Relative Humidity air	30% - 60%

3.4 Measurement Uncertainty

Conducted Emission (Mains Ports) / TR1
The maximum measurement uncertainty is evaluated as: Mains: 9kHz~150kHz: 2.80dB 150kHz~30MHz: 2.40dB
Conducted Emission (Telecommunication Ports) / TR1
The maximum measurement uncertainty is evaluated as: ISN T800: 150kHz~30MHz: 3.60 dB ISN T8-Cat6: 150kHz~30MHz: 3.50 dB ISN ST08: 150kHz~30MHz: 3.10 dB
Radiated emission / AC1
The maximum measurement uncertainty is evaluated as: Horizontal: 30MHz~300MHz: 3.50 dB 300MHz~1GHz: 3.20 dB 1GHz~18GHz: 4.80 dB Vertical: 30MHz~300MHz: 3.60 dB 300MHz~1GHz: 3.10 dB 1GHz~18GHz: 4.50 dB
Radiated emission / AC5
The maximum measurement uncertainty is evaluated as: Horizontal: 30MHz~300MHz: 3.90 dB 300MHz~1GHz: 3.60 dB 1GHz~18GHz: 5.00 dB Vertical: 30MHz~300MHz: 3.80 dB 300MHz~1GHz: 3.50 dB 1GHz~18GHz: 4.80 dB
Harmonic current emissions / TR20
The maximum measurement uncertainty is evaluated as: 1.8 %.
Voltage fluctuation and flicker / TR20
The maximum measurement uncertainty is evaluated as: 1.5 %.
Electrostatic discharge / AC4
The maximum measurement uncertainty is evaluated as Rise Time: 6.4 %, Peak Current: 6 %, Current at 30 ns: 6 %, Current at 60 ns: 6 %.
Radio frequency electromagnetic field / AC4
The maximum measurement uncertainty is evaluated as 1.48dB.
Electrical fast transients / TR2
The maximum measurement uncertainty is evaluated as Voltage: 4%, Time: 2%.

Surges / TR2
The maximum measurement uncertainty is evaluated as Voltage: 4%, Time: 2%.
Radio-frequency continuous conducted / TR2
The maximum measurement uncertainty is evaluated as CDN: 1.52dB, EM Clamp: 1.92dB.
Power-frequency magnetic field / TR20
The maximum measurement uncertainty is evaluated as 10%.
Voltage dips and interruptions / TR20
The maximum measurement uncertainty is evaluated as Voltage: 4%, Time: 2%.

3.5 Equipment List

Conducted Emission(Mains Ports)/ TR1

Instrument	Manufacturer	Model No.	Serial No.	Cali. Due Date

4 EMISSION TEST RESULTS

Conducted emission (Main Ports)

Limits of conducted emission for AC mains power input/output ports		
Frequency range MHz	Limits dB(μ V)	
	Quasi-peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5	56	46
5 to 30	60	50

NOTE 1: The lower limit shall apply at the transition frequencies.
 NOTE 2: The limit decreases linearly with the logarithm of the frequency in the range 0.15MHz to 0.50MHz.

Limits of conducted emission for DC power input/output ports		
Frequency range MHz	Limits dB(μ V)	
	Quasi-peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5	56	46
5 to 30	60	50

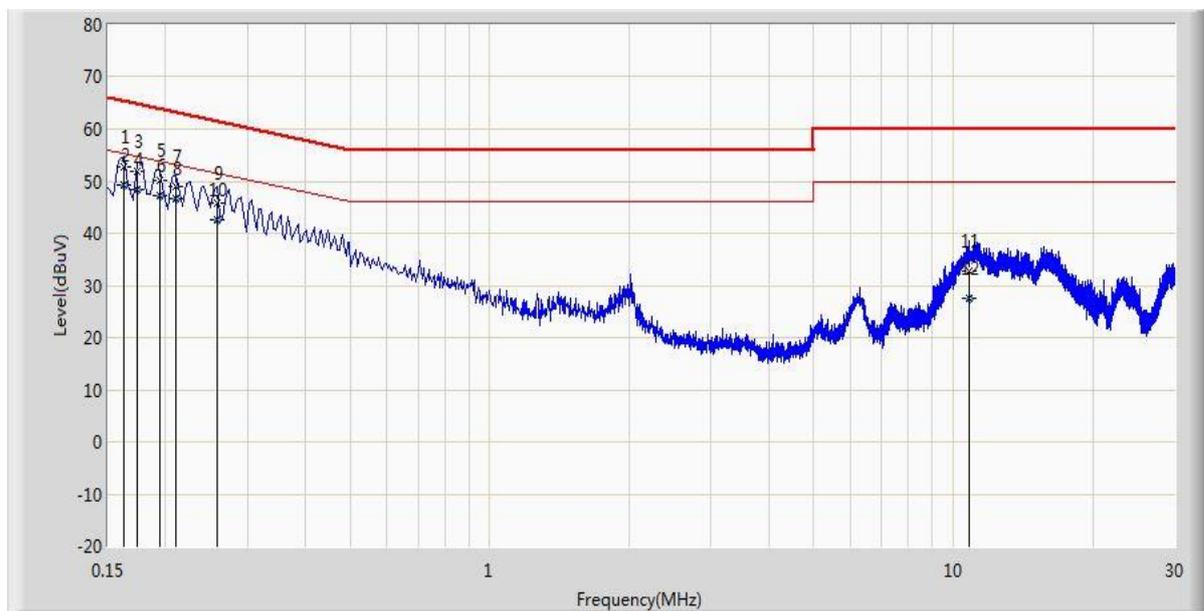

Note 1: At transitional frequencies the lower limit applies.
 Note 2: Applicable only to ports intended for connection to:

- a local DC power network, or
- a remote local battery by a connecting cable exceeding a length of 30 m.

Port	AC output
Test method	LISN
Mode	Normal Operation

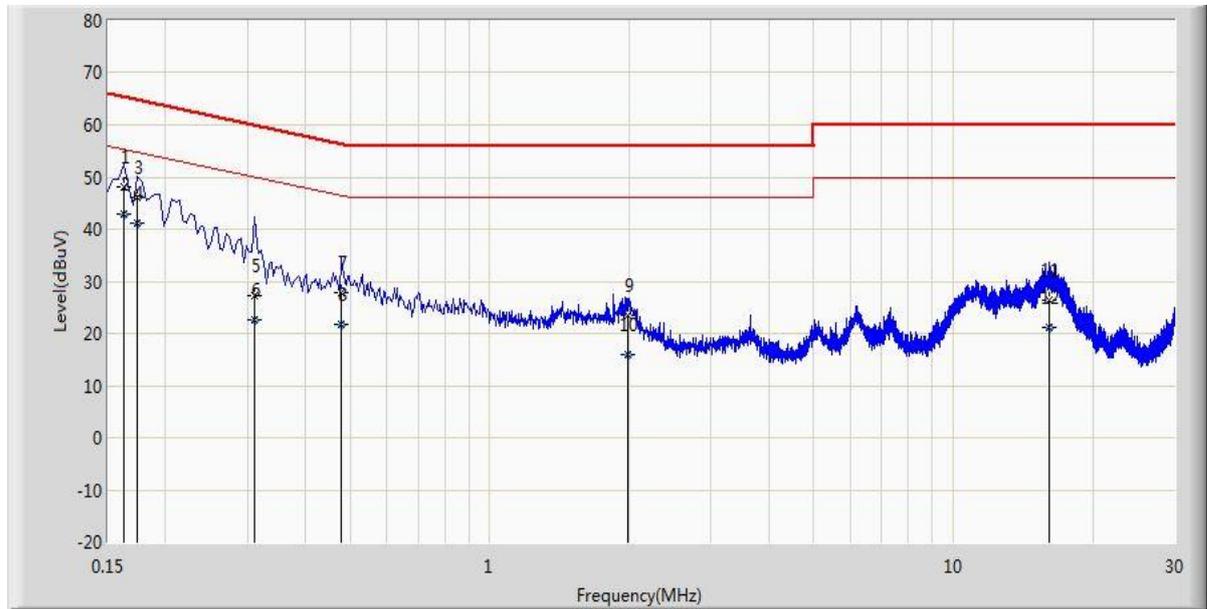

Test Result

Neutral

Conclusion:

PASS

4.1 Conducted Emissions (Telecommunication Ports)

Limits of conducted common mode (asymmetric mode) disturbance at telecommunication ports in the frequency range 0.15MHz to 30 MHz				
Frequency range MHz	Voltage Limits dB(μV)		Current limits dB(μA)	
	Quasi-peak	Average	Quasi-peak	Average
0.15 to 0.50	84 - 74	74 - 64	40 - 30	30 - 20
0.50 to 30	74	64	30	20

NOTE 1: The limits decrease linearly with the logarithm of the frequency in the range 0.15MHz to 0.5MHz.
 NOTE 2: The current and voltage disturbance limits are derived for use with an impedance stabilization network (ISN) which presents a common mode (asymmetric mode) impedance of 150Ω to the telecommunication port under test (conversion factor is $20 \log_{10} 150 / I = 44\text{dB}$).

Test Result

The EUT does not contain the wired network port, so it needs not to perform this test item.

4.2 Radiated Emission

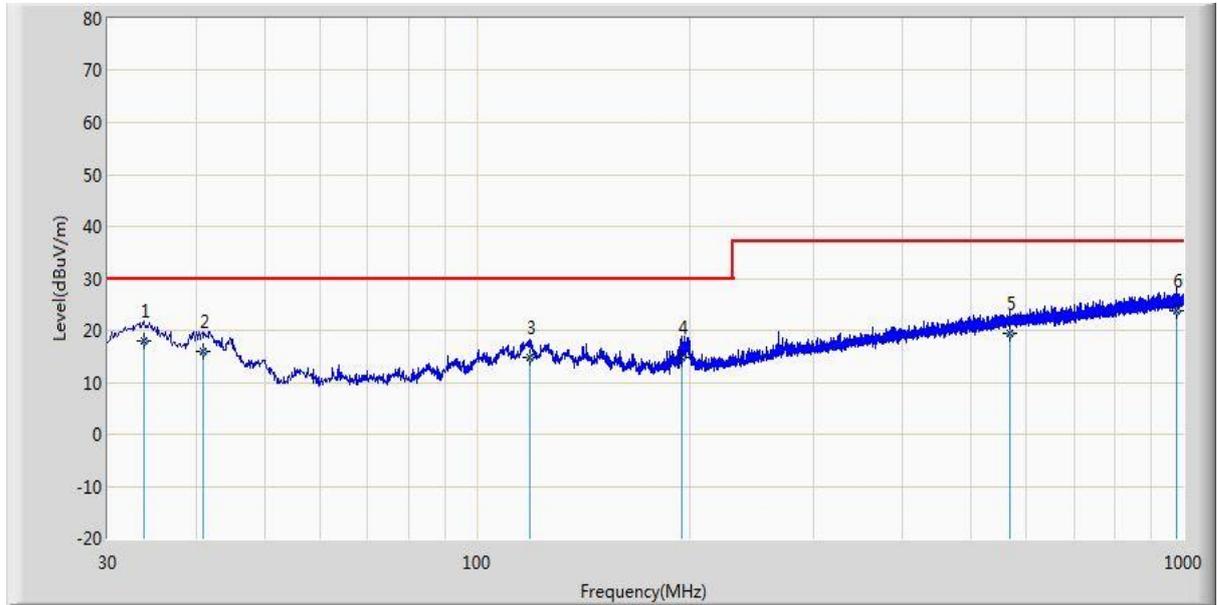

Limits for radiated emission at a measuring distance of 10m		
Frequency range MHz	Quasi-peak limits dB(μ V/m)	
30 to 230	30	
230 to 1000	37	
Limits for radiated emission at a measuring distance of 3m		
Frequency range GHz	Average limit dB(μ V/m)	Peak-peak dB(μ V/m)
1 to 3	50	70
3 to 6	54	74

Note 1: If the internal emission source(s) is operating at a frequency below 9 kHz then measurements need only to be performed up to 230 MHz.

Note 2: At transitional frequencies the lower limit applies.

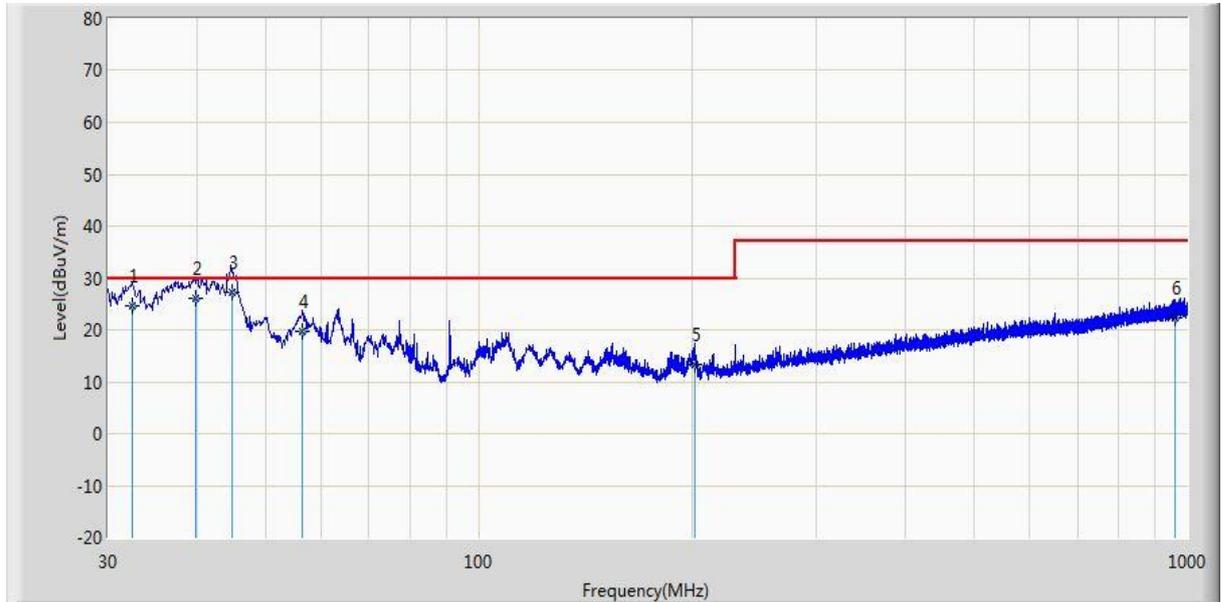

Test Result of Below 1GHz

4.4 Voltage fluctuations and flicker

Standard	EN 61000-3-3 $\leq 16A$ EN 61000-3-11 $> 16A$ and $\leq 75A$
Port	AC Mains supply
Voltage	230 V
Mode	Normal Operation

Equipment intended to be connected to 230/400 V_{AC} 50 Hz supply systems may not produce voltage fluctuations in the supply systems due to variation of the input current above the limits as stated below.

P _{ST}	≤ 1
P _{LT}	≤ 0.65
T _{max}	$\leq 500ms$
d _C	$\leq 3,3\%$
d _{MAX}	$\leq 4\%$

Results of (EN 61000-3-3)

Relative voltage change characteristic T _{max}	0 ms
Maximum voltage change d _{MAX}	0.07%
Relative Voltage change d _C	0.00%
Short term flicker P _{ST}	0.064
Long term flicker P _{LT}	0.064

Results of (EN 61000-3-11)

Relative voltage change characteristic T _{max}	0 ms
Maximum voltage change d _{MAX}	0.06%
Relative Voltage change d _C	0.00%
Short term flicker P _{ST}	0.255
Long term flicker P _{LT}	0.237

Conclusion:

PASS

5 IMMUNITY TEST RESULTS

5.1 Electrostatic discharge immunity

Electrostatic discharges (ESD) are the result of persons or objects that accumulate static electricity due to for instance walking on synthetic carpets. The ESD can influence the operation of equipment or damage its electronics, either by a direct discharge or indirectly by coupling or radiation. Both effects are simulated during the tests.

Environmental phenomenon	Test specification	Units	Performance criterion
Enclosure port			
Electrostatic discharge	±4 (Contact discharge)	kV (Charge voltage)	B
	±8 (Air discharge)	kV (Charge voltage)	

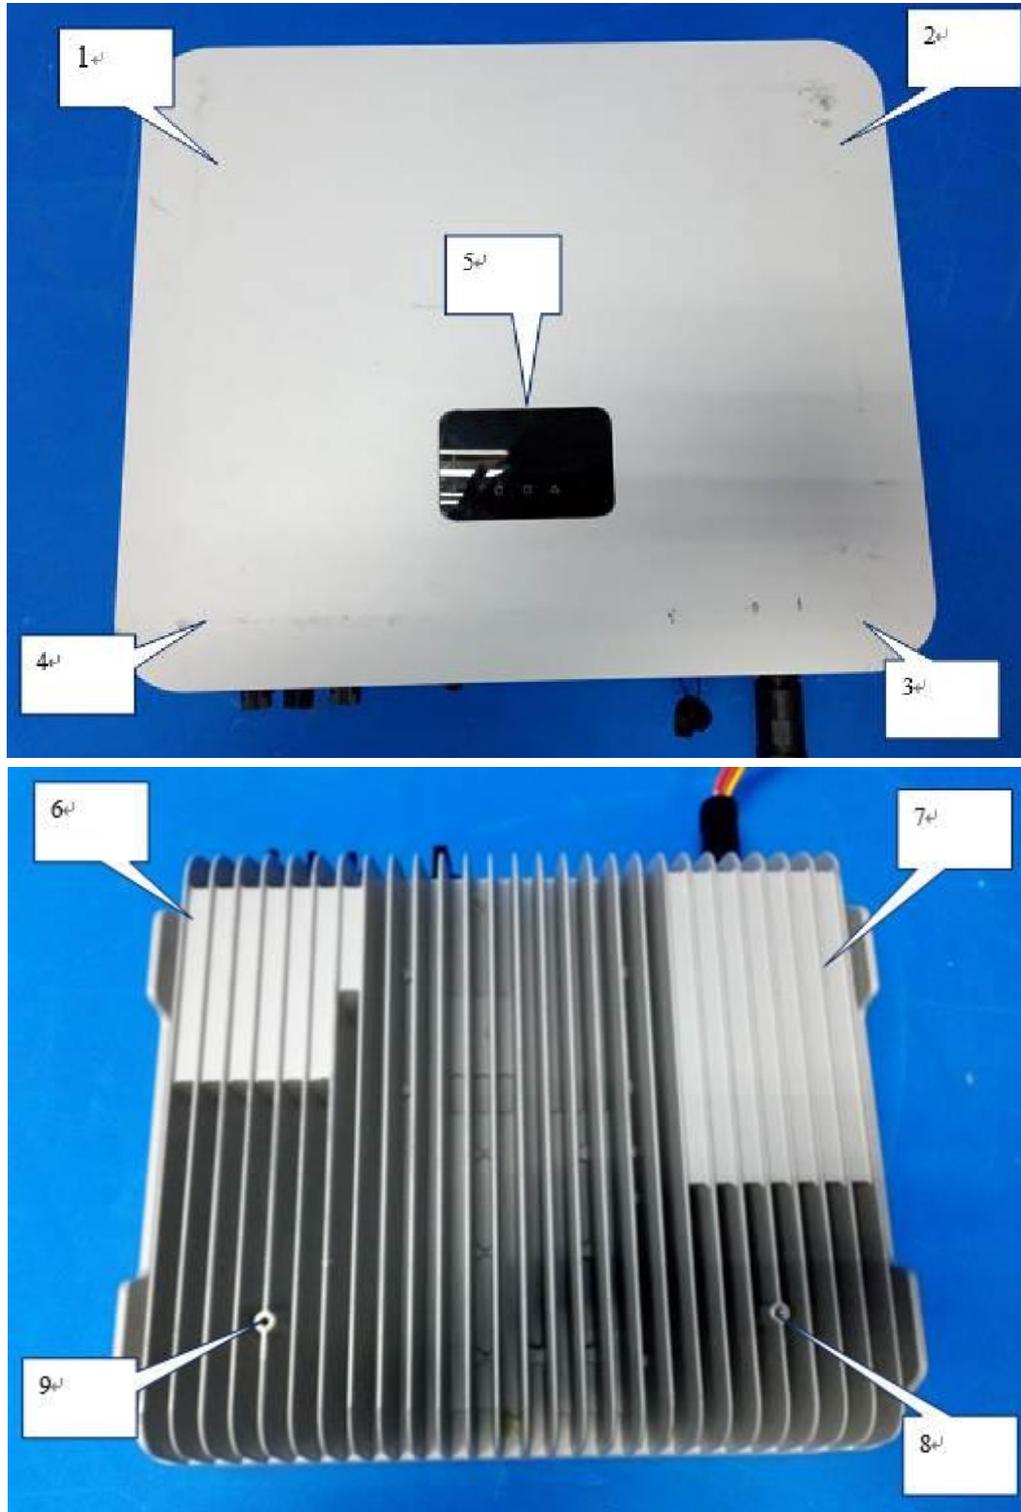

Performed tests

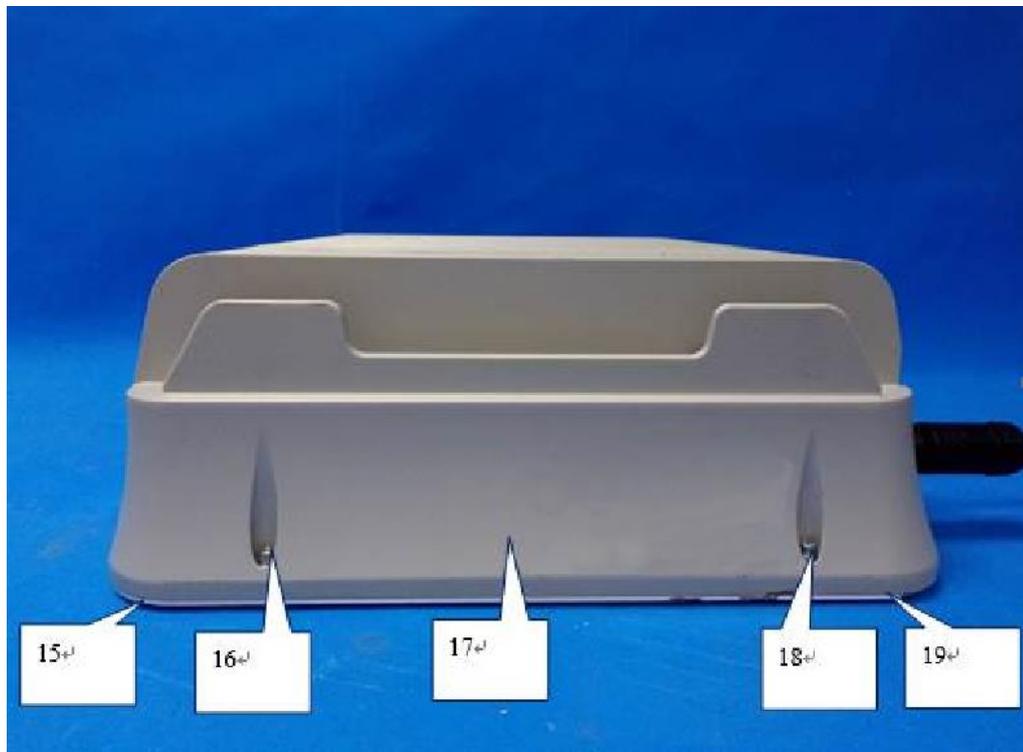

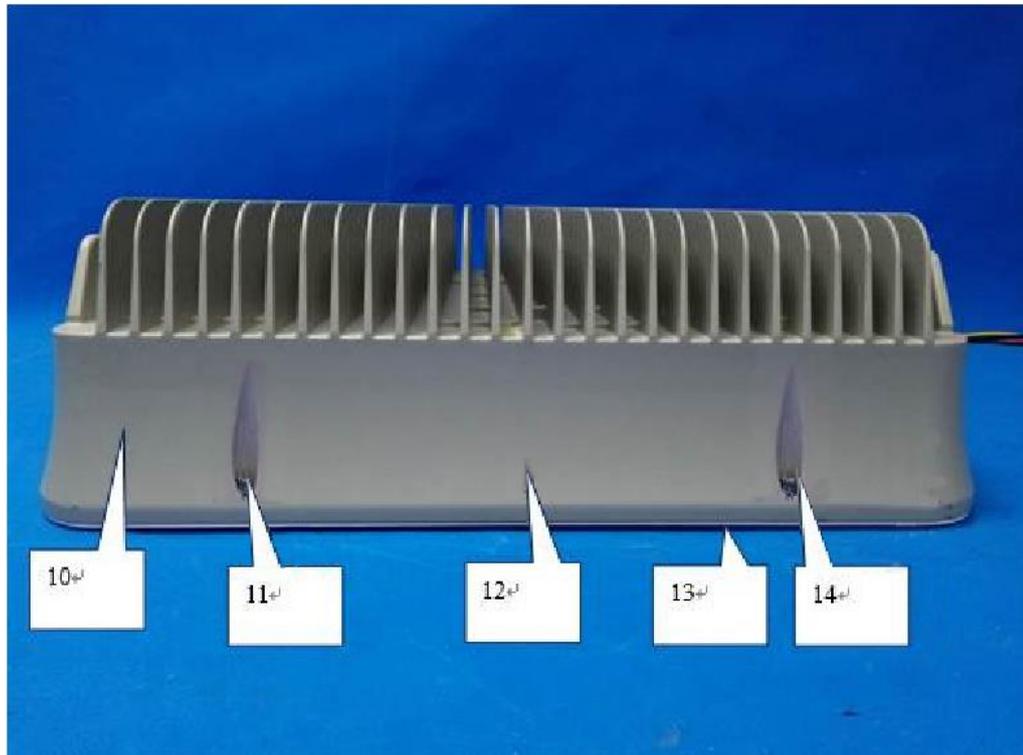

Air discharges	✓	2 kV	✓	4 kV	✓	8 kV	Test Location (28-30)
Contact discharges	✓	2 kV	✓	4 kV		8 kV	Test Location (1-27)
Via coupling planes	✓	Horizontal			✓	Vertical	
Polarity	✓	Positive			✓	Negative	
Set-up	✓	Table-top				Floor standing	
Ambient temperature	24 °C						
Relative Humidity air	48 %						
Mode	Normal Operation						

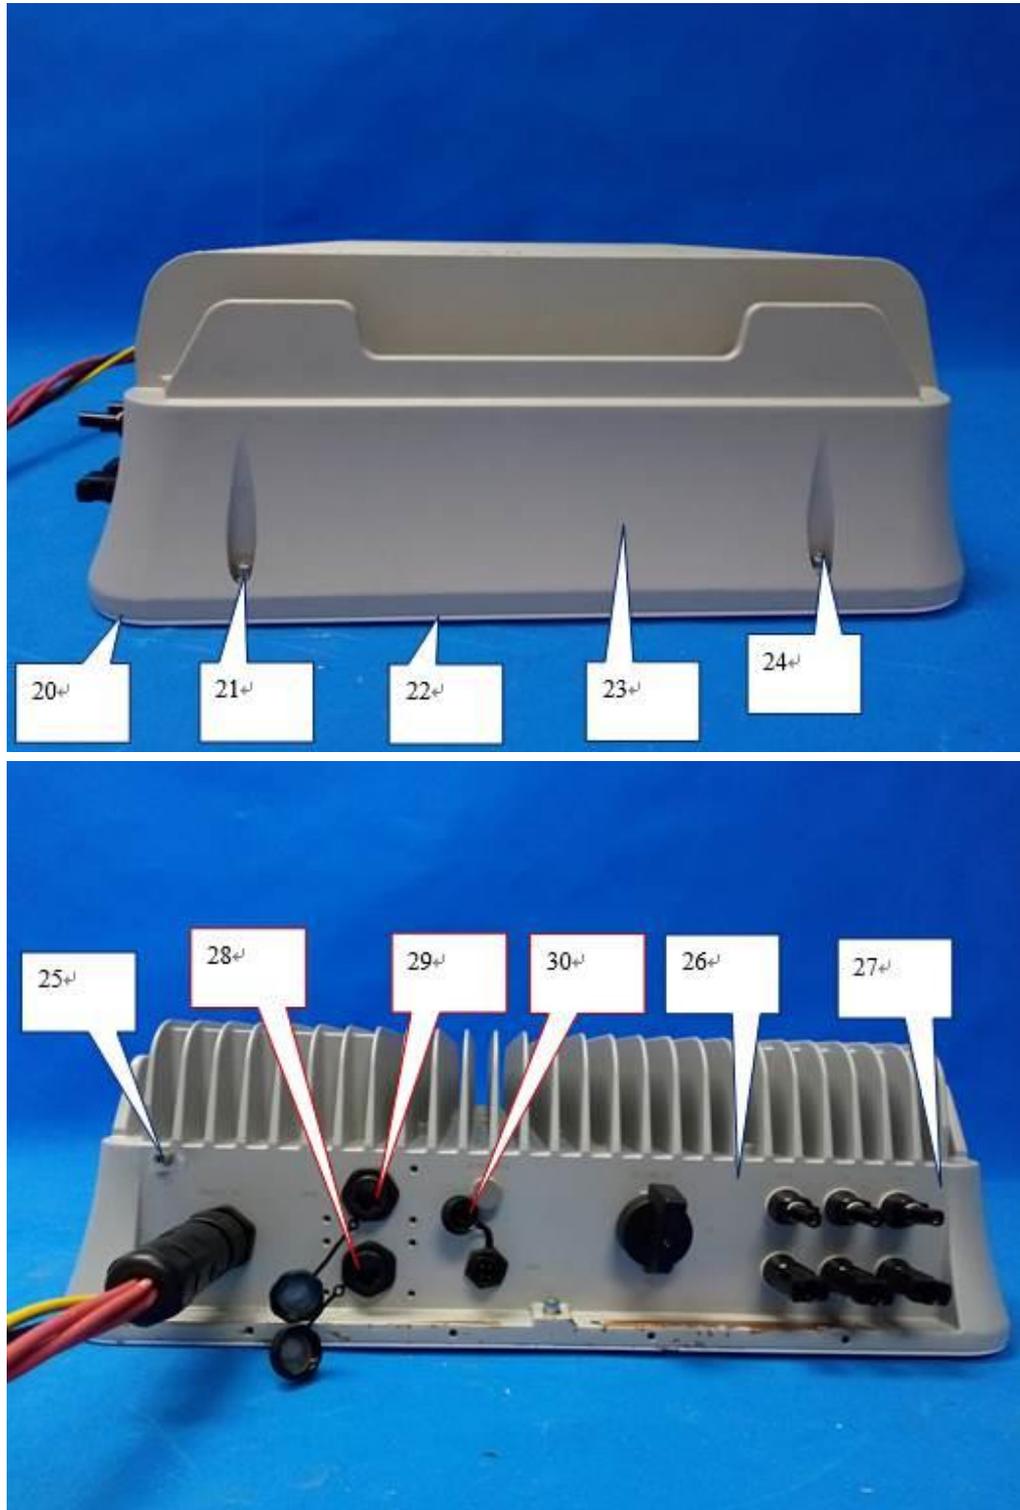

Observations

During the test no loss of performance was observed. After the test the EUT functioned as intended. No unacceptable loss of performance was observed.

Electrostatic discharge Test Location

Conclusion:

PASS

5.2 Radio frequency electromagnetic field

During the test it is verified if the equipment under test has sufficient immunity against radiated electromagnetic fields. Walkie-talkies, radio transmitters, television transmitters, and telecommunication equipment including cellular telephones and other emitting devices, like industrial electromagnetic sources can generate these fields.

Item	Environmental Phenomena	Units	Test Specification	Performance Criteria
Enclosure port				
Radio-Frequency Electromagnetic Field Amplitude Modulated (See Note 1,2)		MHz V/m (Un-modulated, rms) % AM (1kHz)	80 – 1000 10 80	A
Radio-Frequency Electromagnetic Field Amplitude Modulated (See Note 2,3)		MHz V/m (Un-modulated, rms) % AM (1kHz)	1400 – 2000 3 80	A
Radio-Frequency Electromagnetic Field Amplitude Modulated (See Note 2,3)		MHz V/m (Un-modulated, rms) % AM (1kHz)	2000 - 2700 1 80	A
Note :				
1. Except for the ITU broadcast frequency bands 87 MHz to 108 MHz, 174 MHz to 230 MHz, and 470 MHz to 790 MHz, where the level shall be 3 V/m.				
2. IEC 61000-4-20 may be used for small EUTs as defined in IEC 61000-4-20 subclause 6.1.				
3. The frequency range has been selected to cover the frequencies with the highest potential risk of a disturbance.				

All the scanning conditions are as follows:

	Condition of Test	Remarks
1.	Field Strength	10V/m, 3V/m,1V/m
2.	Radiated Signal	AM 80% Modulated with 1kHz
3.	Scanning Frequency	80 - 1000MHz, 1400 - 2000MHz, 2000 - 2700MHz
4.	Dwell Time	3 Seconds
5.	Frequency Step Size Δf	1%

Performed tests

Frequency range	80 - 1000MHz, 1400 - 2000MHz, 2000 - 2700MHz
Tested Field strength	10V/m, 3V/m,1V/m
Dwell time	3 seconds
Test set-up	Full Anechoic Chamber
Mode	Normal Operation

Observations

During the test no loss of performance was observed. After the test the EUT functioned as intended. No unacceptable loss of performance was observed.

Conclusion:**PASS**

5.3 Fast transients common mode

The EFT immunity test simulates disturbances by bursts of very short transients caused for example by switching off loads such as an AC motor or bouncing relay contacts. The transients are likely to disturb electronics but less likely to cause damage.

Environmental phenomenon	Test specification	Units	Performance criterion
Input a.c. power ports			
Fast transients	±2 5/50 5	kV (open circuit test voltage) Tr/Th (ns) Repetition frequency (kHz)	B
Input d.c. power ports			
Fast transients	±2 5/50 5	kV (open circuit test voltage) Tr/Th (ns) Repetition frequency (kHz)	B
Signal ports and telecommunication ports (See Note 1)			
Fast transients	±1 5/50 5	kV (open circuit test voltage) Tr/Th (ns) Repetition frequency (kHz)	B
NOTE 1: Applicable only to ports interfacing with cables whose total length according to the manufacturer's functional specification may exceed 3 m.			

Performed tests

Tested Voltage	2 kV; AC output power port			
Mode	Normal Operation			
Injection method	✓	CDN		Capacitive clamp
Polarity	✓	Positive	✓	Negative
Set-up	✓	Table-top		Floor standing

Observations

During the test, the alarm will be raised and the disturbance will be restored to normal after it is stopped.

Conclusion:**PASS**

5.4 Surge

The surge transient immunity test simulates the surges that are caused by overvoltages due to indirect (induced) lightning transients. The pulse is a slow transient with high-energy contents and due to its long duration may cause damage to an unprotected EUT.

Environmental phenomenon	Test specification	Units	Performance criterion
Input a.c. power ports			
Surges	1.2/50 (8/20) ±1 line to line ±2 line to earth (ground)	Tr/Th (us) kV (open circuit test voltage) kV (open circuit test voltage)	B
Input d.c. power ports (See Note 1)			
Surges	1.2/50 (8/20) ±0.5 line to line ±0.5 line to earth (ground)	Tr/Th (us) kV (open circuit test voltage)	B
Signal ports and telecommunication ports (See Note 2, 3)			
Surges Line to Ground	1.2/50 (8/20) ±1	Tr/Th (us) kV (open circuit test voltage)	B
NOTE:			
<p>1. Not applicable to input ports intended for connection to a battery or a rechargeable battery which must be removed or disconnected from the apparatus for recharging. Apparatus with a DC power input port intended for use with an AC–DC power adaptor shall be tested on the AC power input of the AC- DC power adaptor specified by the manufacturer or, where none is so specified, using a typical AC–DC power adaptor. The test is applicable to DC power input ports intended to be connected permanently to cables longer than 3 m.</p> <p>2. Applicable only to ports interfacing with cables whose total length according to the manufacturer’s functional specification may exceed 30 m.</p> <p>3. Where normal functioning cannot be achieved because of the impact of the CDN on the EUT, this test is not required.</p>			

Performed tests

Tested Voltage; Port	1 kV; AC output power port (Line to Line) 2 kV; AC output power port (Line to Ground)			
Mode	Normal Operation			
Polarity	✓	Positive	✓	Negative

Observations

During the test, the alarm will be raised and the disturbance will be restored to normal after it is stopped.

Conclusion:**PASS**

5.5 Radio frequency common mode

During this test the immunity of the equipment for induced or conducted electromagnetic fields is checked. Fields generated by radio and other transmitters cause RF voltages in long cables like the mains network. This test reproduces these induced disturbing voltages by injecting them to the EUT via the cabling.

Environmental phenomenon	Test specification	Units	Performance criterion
Input a.c. power ports (See Note 1,2)			
Radio-frequency	0.15 - 80	MHz	A
continuous	10	V (unmodulated, r.m.s)	
conducted	80	% AM (1kHz)	
Input d.c. power ports (See Note 1,2)			
Radio-frequency	0.15 - 80	MHz	A
continuous	10	V (unmodulated, r.m.s)	
conducted	80	% AM (1kHz)	
Signal ports and telecommunication ports (See Note 1,2,3)			
Radio-frequency	0.15 - 80	MHz	A
continuous	10	V (unmodulated, r.m.s)	
conducted	80	% AM (1kHz)	
NOTE:			
1. The test level can also be defined as the equivalent current into a 150 Ω load.			
2. Except for the ITU broadcast frequency band 47 MHz to 68 MHz, where the level shall be 3 V.			
3. Applicable only to ports interfacing with cables whose total length according to the manufacturer's functional specification may exceed 3 m.			

All the scanning conditions are as follows:

	Condition of Test	Remarks
1.	Field Strength	10V
2.	Radiated Signal	AM 80% Modulated with 1kHz
3.	Scanning Frequency	0.15 - 80MHz
4.	Dwell Time	3 Seconds
5.	Frequency Step Size Δf	1%

Performed tests

Tested level; Port	10 V; AC output power port		
Mode	Normal Operation		
Frequency range	0,15 – 80 MHz		
Dwell time	3 seconds		
Injection method	✓	CDN	EM clamp

Observations

During the test no loss of performance was observed. After the test the EUT functioned as intended. No unacceptable loss of performance was observed.

Conclusion:**PASS**

5.6 Power-frequency magnetic field

Environmental phenomenon	Test specification	Units	Performance criterion
Enclosure port(See Note 1,2)			
Power-frequency magnetic field	50,60 30	Hz A/m (r.m.s)	A
<p>NOTE:</p> <p>1. Applicable only to apparatus containing devices susceptible to magnetic fields.</p> <p>2. For CRTs, the acceptable jitter depends upon the character size and is calculated for a test level of 1 A/m as follows:</p> $J \leq \frac{(3C + 1)}{40}$ <p>where jitter J and character size C are in millimetres.</p> <p>As jitter is linearly proportional to the magnetic field strength, tests can be carried out at other test levels extrapolating the maximum jitter level appropriately.</p>			

Performed tests

Tested level	30 A/m					
Mode	Normal Operation					
Frequency	50 Hz					
Dwell time	60 seconds					
Test Coil Position	✓	X Axis	✓	Y Axis	✓	Z Axis

Observations

During the test no loss of performance was observed. After the test the EUT functioned as intended. No unacceptable loss of performance was observed.

Conclusion:

PASS

6 IDENTIFICATION OF THE EQUIPMENT UNDER TEST
